User Research

WHAT DO YOU
THINK OF
MY
COOL
IDEA?

What is User Research?

“User research focuses on understanding user behaviours, needs, and motivations through observation techniques, task analysis, and other feedback methodologies.” (source: usability.gov)

Why is User Research important?

“The most fundamental reason for doing user research is that it’s the *only* way to achieve an understanding of the people who are going to use your design. If you understand your users, you can make designs that are relevant for them. If you don’t have a clear understanding of your users, you have no way of knowing whether your design will be relevant. A design that is not relevant to its target audience will never be a success.” (source: interaction-design.org)

Here are just a few User Research methods...

1. User interviews

Good for finding out individual user opinions, recalling events, and discussing them.

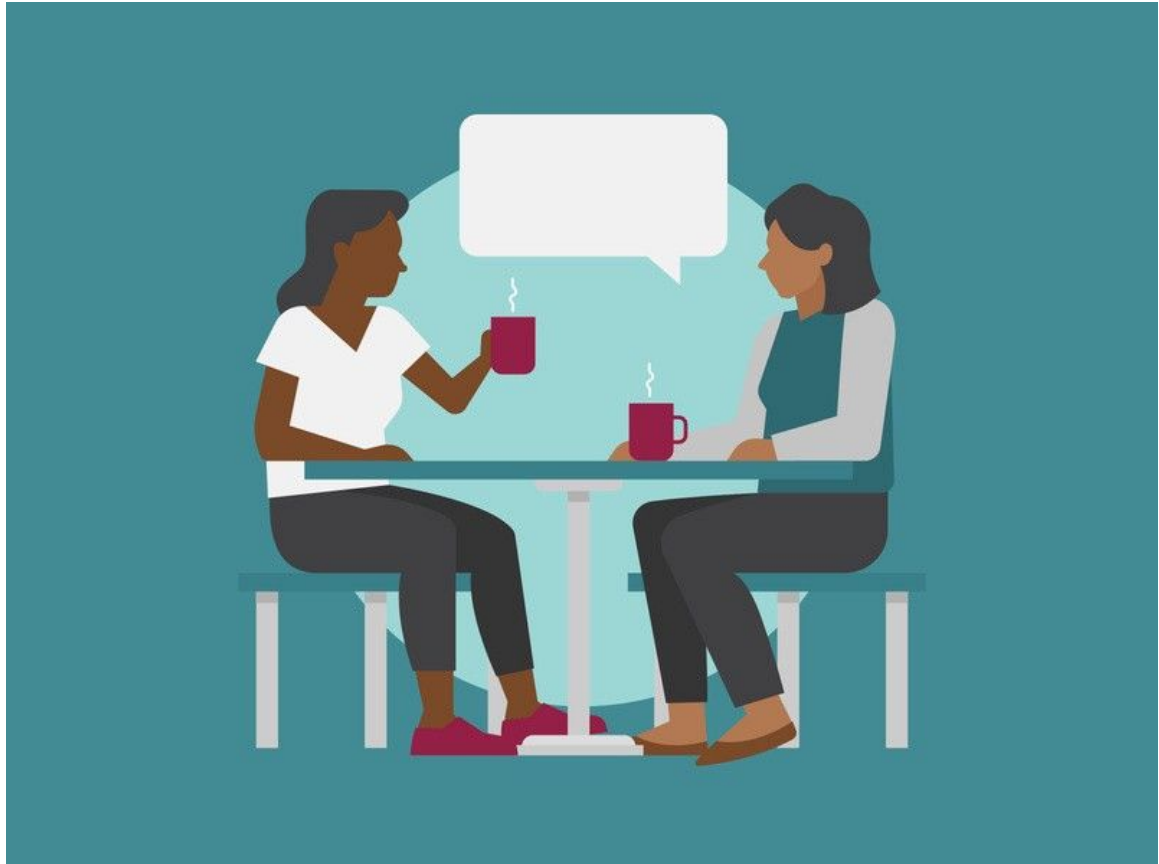

Image: uxdesign.cc

2. Focus groups

Good for understanding your users and the wider impact this has on how they may engage with your product

Image: rucker.armymwr.com

3. Surveys

Good for when you have specific questions and hypotheses to test.

Image: www.mycustomer.com

4. Diary Studies

Good for contextual understanding of user behaviours and experiences over time

Image: playbookux.com

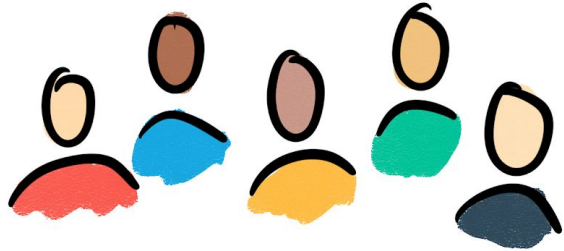

5. User testing

Good for validating the demand for a product or the product or service.
